When changing the timing belt also

REPLACE THE OIL SEALS

Wear risks for shaft seals

Fibres, elastomers and plastics are the basic constituents of a timing belt. Most of these materials are sensitive to the effects of weathering or temperature change and are thus subject to a degree of „ageing“.

The belt also reacts to contact with engine oil. If the shaft seals leak, the belt comes into contact with oil and its useful lifetime is reduced. As a result, the belt may rupture, causing damage to the engine. If the timing belt fails, then the vehicle owner will be faced with a large repair bill!

OEMs recommend changing timing belts after roughly 37,000 – 74,000 miles or after 8-10 years if mileage is lower. In addition, we also advise you to replace your oil seals when replacing the timing belt or tension roller.

This is because replacing these oil seals is crucial to ensure longlasting repairs and satisfied garage customers.

Our solution for you: the CORTECO Simmerring® seal set for timing belt replacement

- Replacing the seals lowers the risk of belt failure caused by oil leaks
- The Simmerring® seal set for timing belt replacement contains crankshaft and camshaft seals to match the engine model and includes auxiliary shaft seals as required
- No need to search for the oil seals you need: we provide you with all of the Simmerring® seals in one set

Our advice: never replace the timing belt without replacing the oil seals!

Overleaf you will find a selection of the most popular timing belt sets.
